1. Data Set Description:

Data are available for samples collected using Partisol Model 2025-D samplers between late 2000 and late 2003 variously from sites at Downey, Claremont, Riverside, Rubidoux, and the University of Southern California (USC). Samples were collected episodically, frequently for a 24-hour per period, but in some cases multiple samples were collected over the course of a day. Element/metals, nitrate/sulfate ion, and mass concentration data were obtained.

The Partisol is a dichotomous sequential multi-filter air sampler. It uses a virtual impactor to divide the air stream to facilitate the collection of fine (0.0-2.5um) and coarse (2.5-10.0um) particles onto a filter media over a pre-programmed collection period. The coarse fraction was analysed using X-ray fluorescence and mass concentration analysis. Ion chromatography and mass concentration analyses were performed on the fine fraction.

The overall objective of the Southern California Supersite (SCS) was to conduct research and monitoring that contributes to a better understanding of the measurement, sources, size distribution, chemical composition, physical state, spatial and temporal variability, and health effects of suspended particulate matter (PM) in the Los Angeles Basin (LAB). Intensive aerosol measurements, well beyond the traditional PM2.5 mass, sulfate and nitrate concentrations, were conducted in several areas of the LAB. These included particle number concentrations, size distributions, and detailed PM chemical composition as a function of particle size. Sampling locations were chosen to provide wide geographical and seasonal coverage, including urban "source" sites and downwind "receptor" sites. The primary sampling facility, a mobile Particle Instrumentation Unit (PIU), was deployed to several locations to conduct a wide range of PM measurements. Sampling in each site lasted for 6-12 months. Intensive PM measurements were also conducted up and downwind of several freeways of the LAB, to characterize near-roadway exposure environments and to support several in vivo and in vitro health studies. The monitoring activities of the SCS were linked with toxicology studies in the LAB using a mobile PM Concentrator facility to investigate health effects associated with exposures to ultrafine, fine and coarse particles. Finally, the PIU facility was successfully used as a platform to develop, test, and evaluate numerous PM measurement instruments and sampling technologies, including several monitors for semi-continuous size fractionated mass and chemistry, personal PM exposure monitors, particle concentration technologies, and particle counting devices.

The U.S. EPA Particulate Matter (PM) Supersites Program was an ambient air monitoring research program from 1999-2004 designed to provide information of value to the atmospheric sciences, and human health and exposure research communities. Eight geographically diverse projects were chosen to specifically address these EPA research priorities: (1) to characterize PM, its constituents, precursors, co-pollutants, atmospheric transport, and its source categories that affect the PM in any region; (2) to address the research questions and scientific uncertainties about PM source-receptor and exposure-health effects relationships; and (3) to compare and evaluate different methods of characterizing PM including testing new and emerging measurement methods. Data collected by these projects are publicly available at the NARSTO Permanent Data Archive, NASA Langley Atmospheric Science Data Center. Data users should acknowledge the U.S. EPA Particulate Matter (PM) Supersites Program and the project investigator(s) listed below.

The data set should be cited as follows:
Sioutas, Constantinos. Rong Chun (RC) Yu. 2010. NARSTO EPA_SS_LOS_ANGELES PM2.5-10 Composition and Mass Data (Partisol). Available on-line from NARSTO Data and Information at the Atmospheric Science Data Center at NASA Langley Research Center, Hampton, Virginia, U.S.A.

More information can be found at the Southern California Particle Center site.

2. Sample Data Record/Data Format:

Data files are in the NARSTO Data Exchange Standard (DES) format that is described in detail on the NARSTO Quality Systems Science Center (QSSC) web site. The files follow a tabular layout and are stored as ASCII comma-separated values files (.csv). The DES does not
rely on row position to identify specific information, but uses a tag to describe the information contained in the row. The DES is a self-documenting format with three main sections: the header contains information about the contents of the file and the data originator; the middle section contains metadata tables that describe/define sites, flags, and other codified fields; and the final section is the main data table that contains key sampling and analysis information and the data values. Descriptions of the standardized metadata fields are also available on the QSSC web site.

Data Usage Notes

- **Data Filename Date Issue:**
  - For NARSTO_EPA_SS_LA_RBDX_PARTISOL_IONs_20010607_20010907_V1.csv the filename does not accurately represent the date range of the content. This file contains data from samples with starting dates from June 27, 2001 through September 07, 2001.

- **MASS Data File Row Totals:**
  - Please note that some data rows in the Partisol MASS files present results that are totals of results in other rows. Check the columns named "Particles: lower diameter bound" and "Particles: upper diameter bound" to understand this reporting convention.

Reporting and Flagging of "Element" Data File Values

- **Data Reporting:**
  - Original concentrations of elements less than 3*uncertainty (3*Sigma) or less than detection limit are reported as "0" and are flagged either "V4" or "V1".
  - Detection Limits (DL) are reported for each variable and Partisol stage. The DL was converted from (ug/filter) to (ug/m3) by dividing by the volume of air sampled.
  - Uncertainties are reported for each variable and Partisol stage which were derived as 1 standard deviation (1 Sigma) from Gaussian Distribution. Uncertainty was converted from (ug/filter) to (ug/m3) by dividing by the volume of air sampled.
  - Original concentration (OC) greater than 3*uncertainty (3*Sigma), detection limit or (blank median*deposit area) were adjusted by the blank median as: Corrected Concentration=Original Concentration - (blank median*deposit area), where the deposit area data were from Chester Lab.
  - The blank sample size at each site and the median concentration for metal/element are given in each site's data file. The blank median was converted from (ug/cm2) to (ug/filter) as: Blank(ug/ filter)= Blank(ug/cm2) * Deposit Area(cm2/ filter). [For example, At this site, blank sample size was 39. The medians for each metal/element are: Ag=0.0017, Al=0, As=0, Ba=0.0306, Br=0.0001, Ca=0.0017, Cd=0, Cl=0, Co=0, Cr=0.0003, Cu=0, Fe=0.0049, Ga=0, Ge=0.0005, Hg=0, In=0.0001, K=0, La=0.0001, Mg=0, Mn=0.0001, Mo=0.0005, Na=0.0525, Ni=0, P=0.0004, Pb=0, Pd=0.0017, Rb=0, S=0.0037, Sb=0, Se=0.0006, Si=0.0037, Sn=0.0242, Sr=0, Ti=0, V=0, Y=0, Zn=0.0009, Zr=0.]

- **Data Flagging:**
  - Original concentration (OC) was compared with 3*uncertainty (3*Sigma) and Detection Limit (DL). If OC < 3*Sigma < DL or DL<OC<3*Sigma then the OC was flagged as "V4".
  - Similarly, if OC< DL <3*Sigma or 3*Sigma<OC<DL, it was given a flag of "V1".
  - Otherwise, for OC > both DL and 3*Sigma, the label "V0" was given.
  - If OC> both DL and 3*Sigma but OC< (blank median*deposit area), a flag "V4" was given.

Outlier Detection for All Data Types

- Outliers were detected by a modified Z-score method. Statistical discussions about this method can be found in "Quality Control of Semi-Continuous Mobility Size-Fractionated Particle Number Concentration Data", Rong Chun Yu et al. (2004). Flag "V4" was given for the outliers.

Additional documentation is provided in the element data files.

Time-Series Plots

Time-series plots are included for all of the numeric variables in each of the data files. These plots are useful for screening for outliers and visualization of values less than the detection limit and values with other quality flags. Please note that some but not all of the plots were visually examined for possible outliers and other issues.
